Figure 4. Variance Decomposition. An Individual Result Y_{ijk} (ie, the result for a single replicate) in a $20 \times 2 \times 2$ study, modeled as the vector sum of deviations— $D_i + R_{j(i)} + \epsilon_{k(ij)}$ —from the sample’s mean, μ , due to the combined effect of three composite sources of random variation—namely, day-to-day (D), run-to-run within-day (R), and within-run or residual (ϵ) variance components—with distributions characterized by SDs of σ_D , σ_R , and σ_ϵ , respectively. The heavy, single-headed arrows represent the magnitude and direction of the overall (total) and three source-specific deviations (shifts). The thin, double-headed arrows represent the magnitudes of the respective SDs.
